ABSTRACT:

PURPOSE: To efficiently select the final idea out of many ideas thought up by the participants of a conference by displaying the idea inputted by an idea input device after the position of a divided screen where the idea is displayed is specified from the idea input device or a controller.

CONSTITUTION: When the proposer of the idea inputs the idea from the idea input device, which is the nearest to him, out of the plural idea input devices 2a-2i in the conference for thinking up the ideas, the idea is inputted after

specifying the position of' the devided screen, which is obtained by previously dividing the screen by the controller 8 and positionally displayed, on the screen of an idea display device 4. The inputted data is displayed on the specified divided screen after the data system of the idea is converted to a system for displaying on the divided screen through the controller 8. The position where the idea is displayed is changed by the controller 8. Thus, the conference for thinking up the ideas is allowed to rapidly and efficiently progress so that the final idea may be decided through the comparison and the examination of the plural ideas by a simple mechanical operation.
